Projeto Resposta em Frequência Compensador por Avanço de Fase

Engenharia de Automação Industrial

CEFET-MG / Campus Araxá Prof. Henrique José Avelar

Um compensador por Avanço de Fase aproxima o compensador PD real, com uma estrutura que contém um zero e um pólo (mais afastado da origem).

$$G_c = K_c \frac{\left(s - z_c\right)}{\left(s - p_c\right)} \rightarrow G_c = \frac{1}{\beta} \frac{\left(s + \frac{1}{T}\right)}{\left(s + \frac{1}{\beta T}\right)}$$

Equação do compensador

$$G_{c} = \frac{1}{\beta} \frac{\left(s + \frac{1}{T}\right)}{\left(s + \frac{1}{\beta T}\right)}$$

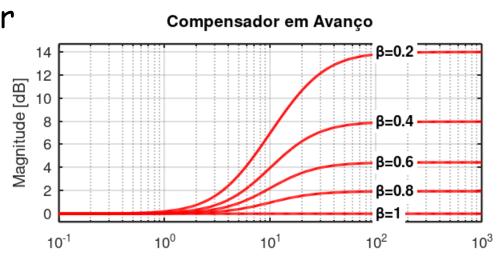

$$0 < \beta < 1$$

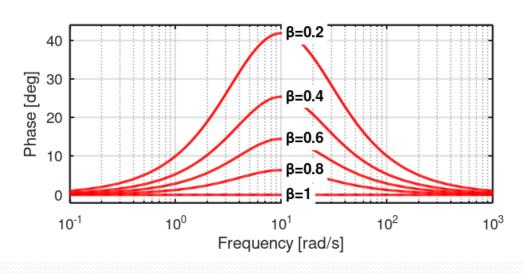

ou

$$G_c = \frac{\left(Ts+1\right)}{\left(\beta Ts+1\right)}$$

ou ainda (K_c>1)

$$G_c = K_c \frac{(Ts+1)}{(\alpha Ts+1)}; 0 < \alpha < 1$$

Equações do compensador

$$\left|G_{c}\right|_{dB\,\omega_{m}}=20\log\left(\frac{1}{\sqrt{\beta}}\right)$$

$$\left|G_{c}\right|_{dB_{m\acute{a}x}} = 20\log\left(\frac{1}{\beta}\right)$$

$$\Phi_{\text{max}} = sen^{-1} \left(\frac{1 - \beta}{1 + \beta} \right)$$

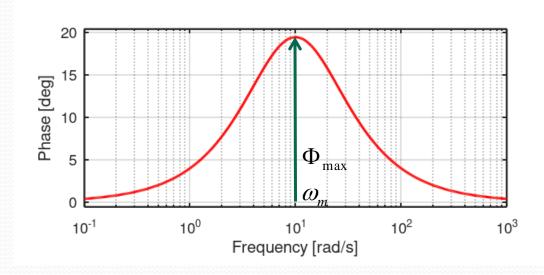

$$\omega_m = \frac{1}{T\sqrt{\beta}}$$
